DETAILED ACTION

Claim Rejections - 35 USC § 103

- 1. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:
 - (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.
- 2. Claims 10-19 are rejected under 35 U.S.C. 103(a) as being unpatentable over Larsson et al. US 20040266339 in view of Panwar et al. US 20060077942.

Regarding claim 10, Larsson discloses a method for packet-switched data transmission (abstract; paragraph [0064] and [0081], transmission of data) in a self- organizing radio network with at least a first and a second radio coverage area, and at least one mobile communication device for each radio coverage area (paragraph [0064] and Fig. 5, with first and second coverage areas CA1 centered at TX 210 and CA 2 centered at Receiver 220 respectively and an intermediate device Relay 215). Larsson discloses operating a first device in the first radio coverage area (Fig. 5, TX 210 on CA1) and a second device in the second radio coverage area (Fig. 5, RX 220 on CA2), for centrally controlling an assignment of transmission channels assigned to the respective radio coverage area (Fig. 5 where Relay unit 215 can act both as a subscriber unit and as base station at the same time). Banniza discloses operating in each of the first and second radio coverage areas mobile communication devices forming

Application/Control Number: 10/590,138

Art Unit: 2617

intermediate stations for forwarding to the second radio coverage area data originating from the first radio coverage area (paragraph [0064] - Fig. 5 where Relay unit 215 can act both as a subscriber unit and as base station at the same time). However Banniza is silent on disclosing thereby operating the first central control device to control the transmission channels available to the first radio coverage area, both for transmitting data between the first central control device and the intermediate station and for transmitting data between the intermediate station and the second central control device.

Page 3

Panwar teaches thereby operating the first central control device to control the transmission channels available to the first radio coverage area, both for transmitting data between the first central control device and the intermediate station and for transmitting data between the intermediate station and the second central control device (paragraph [0042] where each station sends the data packets to a destination station via an intermediate station).

Therefore it would have been obvious to one of ordinary skill in the art at the time of invention to modify the inventions of Banniza and add thereby operating the first central control device to control the transmission channels available to the first radio coverage area, both for transmitting data between the first central control device and the intermediate station and for transmitting data between the intermediate station and the second central control device. The motivation would be in order to transmit a data packet first to an intermediate station, and then to the destination station (paragraph [0022]).

Regarding claim 11, Larsson discloses transmitting control data appended in the transmission with the first central control device on a separate transmission channel (paragraph [0044]).

Regarding claim 12, Panwar teaches the separate transmission channel is an FCH channel (paragraph [0049]).

Regarding claim 13, Panwar teaches if the FCH channel cannot be received by the second central control device, appending with the intermediate station control data for the second central control device to the data to be forwarded (see Fig. 4).

Regarding claim 14, Panwar teaches adding to the control data at least one of an address of the second central control device and a format of the data to be forwarded (see Fig. 4).

Regarding claim 15, Larsson discloses analyzing the control data in the intermediate station (paragraph [0064]).

Regarding claim 16, Larsson discloses analyzing the control data in the second central control device (paragraph [0021]).

Regarding claim 17, Panwar discloses operating the radio network using central medium access control in accordance with a standard selected from the group consisting of IEEE 802.11 standard, IEEE 802.16, Hiperlan/2, and a standard derived therefrom (paragraph [0041]).

Regarding claim 18, Panwar discloses an intermediate station configured for carrying out the method (paragraph [0056]); Fig. 6, Unit 510).

Regarding claim 19, Panwar discloses a central control device configured for carrying out the method (paragraph [0056]); Fig. 6, Unit 510).

Conclusion

1. Any inquiry concerning this communication or earlier communications from the Examiner should be directed to Amanuel Lebassi, whose telephone number is (571) 270-5303. The Examiner can normally be reached on Monday-Thursday from 8:00am to 5:00pm.

If attempts to reach the Examiner by telephone are unsuccessful, the Examiner's supervisor, Nick Corsaro can be reached at (571) 272-7876. The fax phone number for the organization where this application or proceeding is assigned is (571) 273-8300.
